(<https://www.hovatek.com/forum/thread-20497.html>) This guide is for those who wish to create a custom recovery-flashable zip from boot.img and system.img.

This guide is for those who wish to create a custom recovery-flashable zip from boot.img and system.img.

20497.html&wishedtype=sticky_displayforum=andrelease=0 in flashable zip format (not scatter format)

- You have USB port problems and can therefore only rely on SD card and custom recovery mode for flashing

Obtaining boot.img and system.img

Before you proceed, you first need to obtain the boot.img and system.img . You have two options here:

1. Extract both from the phone
2. Extract both from the stock rom / firmware

Mediatek (MTK)

If you wish to extract both files from the phone then consider Miracle Box

(<https://www.hovatek.com/forum/thread-13347.html>) (ensure to rename from .bin to .img) or Wwr_MTK

(<https://www.hovatek.com/forum/thread-21970.html>) . If you can find the stock ROM / firmware for your model

@ <https://www.hovatek.com/forum/forum-89.html> (<https://www.hovatek.com/forum/forum-89.html>) then simply

download the zip, rar or 7z file and extract using 7zip or Winrar.

Spreadtrum (SPD)

If the phone is rooted then consider the adb dd method (<https://www.hovatek.com/forum/thread-1405.html>) or

use a Chinese box like Chinese Miracle II SPD (<https://www.hovatek.com/forum/thread-21776.html>) or NCK

Pro Box. If you can find the stock ROM / firmware / PAC file @ <https://www.hovatek.com/forum/forum-89.html>

(<https://www.hovatek.com/forum/forum-89.html>) then extract the contents of the pac file

(<https://www.hovatek.com/forum/thread-6236.html>)

Requirements for creating flashable zip

- Download Assayed Kitchen @ <https://mega.nz/#!fAlkBZKQ!aS-9yNL9GKgVz...iz-1KnsydA> (<https://www.hovatek.com/redirectcode.php?link=aHR0cHM6Ly9tZWdhLm56LyMhZkFJa0JaS1EhYVMtOXIOTDIHS2dWemdKZDIDNURXSnrqRF9mTI>)
- Boot.img & System.img (obtained using steps above)
- Windows PC & USB cord
- Custom recovery (for flashing your zip once created). You can use our TWRP porters at <https://www.hovatek.com/forum/forum-39.html> (<https://www.hovatek.com/forum/forum-39.html>) if you don't have one

Name	Date modified	Type	Size
Hovatek ROM	9/25/2017 4:04 PM	ZIP File	983,300 KB

Important Notice

- The created flashable zip can only be flashed in a custom recovery. Attempting to flash it in a stock recovery will give a signature error
- Its important you only flash a zip created from images for your device or from its firmware. Flashing a zip meant for another device could brick your phone
- Ensure to make a custom recovery backup before flashing a customized rom
- Its recommended you first create an unmodified flashable zip (no modification using the tool) before creating modified versions

Video Transcript

[20497.html&utm_adtype=sticky_display&utm_medium=sulvo\)](https://www.hovatek.com/forum/thread-20497.html&utm_adtype=sticky_display&utm_medium=sulvo)

In this video tutorial, I'll be showing you how to create a flashable zip using Assayeed kitchen from boot.img and system.img. You might find a flashable zip helpful when you need to port a custom rom or need to flash your phone. but either don't have a PC or your phone's USB port is bad. In this case, you need to flash from recovery mode. Its very important you know that you cannot flash this kind of zip from stock recovery okay? so you need to have a custom recovery (e.g TWRP, Philz, CWM etc) installed before you can flash a zip like this.

Download Assayeed kitchen, check out website for the download link. You'll need the boot.img and system.img pasted in the PLACE folder. Launch Assayeed kitchen [resizing]. Select 1 (Start Creating Project) & tap Enter Its asking me where I want to get the ROM from. I'll just tap Enter since the default is PLACE folder. I have Stock IMG ROM which is by boot and system image. I type 1 and tap Enter. Its asking me to name the ROM I'll name it Hovatek then tap Enter. It'll copy, rename then extract. Some people start with system.new.dat

For that kind of situation, you use MTK extractor to convert from dat to img format then return to Assayeed Its very important you have enough space on your PC because you might run into the "Clean up working folder" error and you'll find out that system wasn't extracted. In that kind of situation, you either don't have enough space or you're trying to extract a signed image [rephrase]. We have a guide on how to unsign an image at our Forum After you unsign, you can the bring the image back to Assayeed. This process takes a while so be patient.

[extracting files from system.img]. Done extracting. What installer do you want? I go with Standalone (2) ROM name, I maintain Hovatek ROM. Wait while it generates the needed files (updater, meta-inf etc). Completed, press Enter to continue. I have my project details displayed; meta-inf, system unpacked You can begin to make any modification you want. I won't be making any. Once done, its time to repack

I'll select Build ROM for flashing (7) then tap Enter. Its asking how you want to pack, I usually go for RAW because it creates boot and system.img so you can decide to flash via fastboot or any flash tool you wish to use Now, its asking me for the /system mount point. I could select kernel (boot.img), device (I connect) or manual I advise you go for the default (kernel). If you encounter /system mount errors then get the mount point then go for manual. We have a guide on how to find the mount point of Mediatek or Spreadtrum at our Forum.

Type the name of your ROM, tap Enter. [Creating Symlinks]. Its asking If I want to expand my system.img I advise you go with No but If you know what you're doing, select Yes. Asking If I want to zipalign, I select No. [Creating system.img], [Converting Sparse Image to RAW EXT4]. Asking me to type the name of the zip file I maintain Hovatek ROM then tap enter. Compressin level (for the flashable zip), I seleect default (5) [packing in progress]. Asking If I want to sign the zip, I select No (tap Enter).

Done! To check the flashable zip open the ready folder. In my case, I have boot and system image. That's how to create a flashable zip (Mediatek & Spreadtrum) from the boot and system image using Assayeed kitchen.

i end up on a message saying there is no project in work folder please create project first

Did you copy boot.img and system.img to the right folder?

Thanks for replying i managed to solve the problem it was a sign .img file so i unsign and then repeat the procesd and now it works. But im having a 2nd problem everytime I successfully flash my rom via twrp when i reboot it keeps on rebooting i tried all the option given on the kitchen but was unsuccessful

#8 (thread-20497-post-145331.html#pid145331)

I applied the same procedure as described above on my Tecno camon cx air mt6737 android 7.0 and finally ended with bootloop. Is there any fix for this? On the tool is not compatible with the higher android versions (newthread.php?tid=9901) (forum-58.html) (https://www.hovatek.com/training) (https://www.hovatek.com/remote)

I applied the same procedure as described above on my Tecno camon cx air mt6737 android 7.0 and finally ended with bootloop. Is there any fix for this? Or the tool is not compatible with the higher android versions with secured boot?

we'll need to know what's wrong with your device and how the problem started.

Please create a new thread so we focus on it.

See https://www.hovatek.com/forum/thread-514.html (https://www.hovatek.com/forum/thread-514.html) for how to create a thread.
